Scenario: Clinic Appointment Booking Page

Features:

- Responsive Layout - using Bootstrap
- Appointment Form - for user inputs
- Book Button - that updates upon click
- Output Display - to show your appointment
- Cancel Button - to remove the appointment
- Mode Button - to switch between Light and Dark mode

REFLECTION

1. I chose the Clinic Appointment Booking because it is kind of easy to make. Also, I just recently had an appointment at a dental clinic so I thought it would be a good scenario to make.
2. I used the Bootstrap container, row, and column. The container is used to keep the content in the center, and row and columns to split the page into two parts. One side is for the form and the other side is for the output. Also, to help make the website responsive for different screen sizes like phone and desktop.
3. I used simple JavaScript DOM methods like getElementById and innerHTML. These were used to get the input values and show the appointment on the screen. I also used simple functions for booking an appointment, canceling it, and changing the color mode of the page.
4. I had some difficulty in arranging the layout using Bootstrap at first. I was also confused about how the columns work. Though, I managed to fix these by utilizing online resources and testing the code step by step.
5. I learned how to create a simple responsive website using Bootstrap. I also learned how JavaScript can change content on a web page to make it more interactive.
6. I can use this in making simple websites like booking systems and such, as it helped me understand how websites become interactive and responsive.
